Multi-cloud Architecture and Innovations (MAI)

Don't just drift in the clouds, confidently use them to help your business soar

The use of cloud services has become mainstream for business. Cloud services are now numerous and granular. However, these offerings and ways to integrate them can be overwhelming. Even organizations with strong development teams find themselves struggling to keep pace. Old norms collide with new possibilities; reconciling those concepts can be costly to the development process. With some help, a business can reduce costs associated with that learning curve and accelerate the realization of multi-cloud benefits. Let SynerComm Multi-cloud Architecture and Innovations experts guide you through the haze and shine a light on how cloud technologies can benefit you.

Don't drift in the clouds...

Developers and organizations alike are eager to use services in the cloud. So eager that sometimes they leap before they look, taking a narrow focus and turning up point services, not business solutions. This can be a recipe for disaster. Not securing services adequately, such as public storage and open security controls, can lead to data loss and potential breaches. Even with a typical security solution like a firewall, security can be easily circumnavigated without proper controls around cloud networking. Uncontrolled accounts and technical reactions to identified security risks or business demands can mean an explosion of shadow IT cloud services. This cycle can repeat many times over before the business notices it. The resulting runaway costs and security risks can leave the organizations seriously doubting whether "moving to the cloud" is the right decision.

Use the clouds to help your business soar...

Today, customers are conditioned to expect rapid innovation, instant gratification, and extensive communication related to the products and services we purchase. This is because so many organizations effectively utilize cloud services to deliver innovative, scalable market offerings. Soarers accept and embrace that the ever-increasing set of available cloud services represents an opportunity to align with today's customers' expectations and win business from their competition. Drifters and soarers represent extremes; most companies are somewhere in between on the journey from drifting to soaring with cloud services. It is challenging to find and retain staff with the right experience and capability to make satisfactory progress. SynerComm's Multi-cloud Architecture and Innovation services help businesses move more rapidly on that journey and soar with cloud services.

How it Works

Discovery:

- SynerComm listens, collaborates, and consults with customers to understand, articulate, and validate customer-specific needs.
- SynerComm develops concepts to address those needs, and reviews/considers them with the customer: high-level functionality, security, cost, deployment, operation, automation, and scaling concepts.
- SynerComm encourages, facilitates, and supports education on multi-cloud capabilities through the process.

Multi-cloud Solution Architecture and Engineering:

- High-level design involving individual cloud services or integration of multiple cloud services from different cloud service providers along with on-premises solutions.
- Design validation and testing: Functionality, Security, Operation.
- Low-level design and configuration.

Implementation, Integration, Automation, and Migration

Administration, maintenance, and support

Validation and continuous improvement: Functionality, Security, Operation.

Work smarter with SynerComm's Multi-cloud Architecture and Innovation services!

With SynerComm's MAI, you get all the benefits of working with innovative and experienced cloud resources without the costs and risks of staffing, developing, and retaining cloud architects. SynerComm's cloud experts are experienced with all the major cloud providers (AWS, Microsoft Azure, and Google Cloud) and their services. Whether your company is just starting in the cloud or already soaring through multi-cloud solutions, SynerComm's MAI team can assist. Working together, SynerComm can help you maximize your competitive advantage with secure and effective multi-cloud solutions.

More Thoughts/Ideas:

- Problem-solving focused on finding the best fit for an organization
- Security first strategy to make sure implemented solution fits into the companies' security posture and best practices
- Services focused on a deep understanding of how the technologies within the cloud work.

Benefits:

Help build out your cloud and transfer knowledge from experts

Lateral thinking team means we look for many solutions to the problem instead of just one

Works with your team to understand the technologies in use

Security-focused and front of mind for all builds

Hands-on or hands-off, your choice. We can instruct and configure the systems, whichever works for your project and timelines.

Multiple certs in many different technologies with support from vendors.

Partner with SynerComm to test the security of your internet exposed assets year-round.
